1 Base formulas

General supplier function for maximizing profit

for one supplier

$$\begin{aligned} & \max \sum_{region} Q_{sell}(region) * \left(price(region) - C_{trans}(region) \right) \\ & - Q_{prod} * C_{prod} \end{aligned}$$

for all supplier:

$$\pi(supplier) = \sum_{region} Q_{sell}(supplier, region) * \Big(price(region) - C_{trans}(supplier, region)\Big) \\ - Q_{prod}(supplier) * C_{prod}(supplier) \forall supplier$$

Constraints

There are several supplier constraints that must be taken into account.

They have the following logic:

" $Q_{sell} \leq transCap(supplier, region) \leq Q_{prod} \leq productionCap(supplier) \forall supplier, regions$ " We can sepperate this into 3 constraints:

Transport constraint:

$$Q_{sell}(supplier, region) \le transCap(supplier, region) \ \forall \ supplier, regions$$

Selling cap constraint:

$$\textstyle \sum_{region} Q_{sell}(supplier, region) \leq \ Q_{prod}(supplier) \ \forall \ supplier$$

Production cap constraint:

$$Q_{prod}(supplier) \leq ProdCap(supplier) \ \forall \ supplier$$

Make the constraints useable:

We need to apply the following steps for usability in gams:

- 1. introduce lower bound
- 2. split into 2 sepperate equations
- 3. For Laplace: bring constraints into standard form (constraint $\leq 0 \perp$ dual-Variable)
- 4. For GAMS: change equations to ≥ 0 (for gams)

For transport constraint:

- 1. introduce lower bound
 - $0 \le Q_{sell}(supplier, region) \le transCap(supplier, region) \ \forall \ supplier, regions$
- 2. split into 2 sepperate equations
 - $0 \leq Q_{sell}(supplier, region) \ \forall \ supplier, regions$
 - $Q_{sell}(supplier, region) \leq transCap(supplier, region) \ \forall \ supplier, regions$
- 3. For Laplace: bring constraints into standard form
 - $-Q_{sell}(supplier, region) \leq 0: \mu_{transCapLow} \ \forall \ supplier, regions$
 - $Q_{sell}(supplier, region) transCap(supplier, region) \leq 0: \mu_{transCapUp} \forall supplier, regions$
- 4. For GAMS: change equations to ≥ 0

$$Q_{sell}(supplier, region) \ge 0 \ \forall \ supplier, regions$$

$$transCap(supplier, region) - Q_{sell}(supplier, region) \ge 0 \ \forall \ supplier, regions$$

For selling cap constraint:

1. introduce lower bound

$$0 \leq \sum_{region} Q_{sell}(supplier, region) \leq Q_{prod}(supplier) \ \forall \ supplier$$

2. split into 2 sepperate equations

$$0 \leq \sum_{region} Q_{sell}(supplier, region) \, \forall \, supplier$$

$$\sum_{region} Q_{sell}(supplier, region) \leq Q_{prod}(supplier) \, \forall \, supplier$$

- 3. For Laplace: bring constraints into standard form
 - $-\sum_{region} Q_{sell}(supplier, region) \leq 0 : \mu_{sellCapLow} \ \forall \ supplier$

$$\sum_{region} Q_{sell}(supplier, region) - Q_{prod}(supplier) \le 0: \mu_{sellCapUp} \ \forall \ supplier$$

4. For GAMS: change equations to ≥ 0

$$\sum_{region} Q_{sell}(supplier, region) \ge 0 \,\forall \, supplier$$

$$Q_{prod}(supplier) - \sum_{region} Q_{sell}(supplier, region) \ge 0 \ \forall \ supplier$$

For production cap constraint:

1. introduce lower bound

$$0 \le Q_{prod}(supplier) \le ProdCap(supplier) \ \forall \ supplier$$

2. split into 2 sepperate equations

$$0 \le Q_{prod}(supplier)$$

$$Q_{prod}(supplier) \leq ProdCap(supplier)$$

3. For Laplace: bring constraints into standard form

$$-Q_{prod}(supplier) \leq 0 : \mu_{prodCapLow}$$

$$Q_{prod}(supplier) - ProdCap(supplier) \le 0 : \mu_{prodCapUp}$$

4. For GAMS: change equations to ≥ 0

$$Q_{prod}(supplier) \geq 0$$

$$ProdCap(supplier) - Q_{prod}(supplier) \ge 0$$

Object function

$$\max \sum_{region} Q_{sell}(supplier, region) * \Big(price(region) - C_{trans}(supplier, region)\Big) \\ - Q_{prod}(supplier) * C_{prod}(supplier) \forall supplier$$

 \rightarrow chang max to min:

$$\begin{aligned} & \min \sum_{region} Q_{sell}(supplier, region) * \Big(C_{trans}(supplier, region) - price(region) \Big) \\ & + Q_{prod}(supplier) * C_{prod}(supplier) \ \forall \ supplier \end{aligned}$$

 \rightarrow add constraints:

$$-\mu_{transCapLow} * Q_{sell}(supplier, region)$$

$$+\mu_{transCapUp} * (Q_{sell}(supplier, region) - transCap(supplier, region))$$

$$-\mu_{sellCapLow} * \sum_{region} Q_{sell}(supplier, region)$$

$$+\mu_{sellCapUp} * \left(\sum_{region} Q_{sell}(supplier, region) - Q_{prod}(supplier) \right)$$

$$-\mu_{prodCapLow} * Q_{prod}(supplier)$$

$$+\mu_{prodCapUp} * (Q_{prod}(supplier) - ProdCap(supplier))$$

derivation obj for supplier (Q_{sell})

$$\frac{\partial f}{\partial Q_{sell}} = \sum_{region} (C_{trans}(supplier, region) - price(region))$$

 $-\mu_{transCapLow}$

 $+\mu_{transCapUp}$

- $-\sum_{region}\mu_{sellCapLow}$
- $+ \sum_{region} \mu_{sellCapUp}$
- $\forall\, supplier$

derivation obj for supplier (Q_{prod}) :

$$\frac{\partial f}{\partial Q_{prod}} = C_{prod}(supplier)$$

- $-\mu_{sellCapUp}$
- $-\mu_{prodCapLow}$
- $+\mu_{prodCapUp}$
- $\forall\, supplier$
